Individual Project/Milestone 1

My App is going to be a Personal Budget Tracker. Users enter income and expenses, and the app tracks their spending habits.
What it will do.
Who is the audience?
How will it be used?
An example of how it will work.
My website is going to help people who can't keep track of their spending habits. Because they don't really realize how much they spend throughout the day, so that's why I'm trying to help them. That's why my website could help them. Keep track of what they're spending and how much it's gonna cost. My audience is going to be probably the ages 16 to 30. It will keep track of spending habits. And also to help them understand that they can't just spend all their money they need to save.

Be Object-oriented: Classes are a User, Transaction, and Budget.
User input: Enter income and expenses.
GUI: Charts displaying financial information.
Decision making: Warn users when spending exceeds budget limits.
Iteration: Loop through transactions to calculate totals.
Arrays: Store lists of transactions.
